

Day 6 — Flow Bundle v1 Summary

Timestamp (Berlin): 2025-08-10 18:59

What changed since ECG+troponin notebook

- Added **ACS_candidate** logic (atypical ACS support) and kept batched **ECG+troponin 0/1h**.
- Hardened **policy layer**: cooldowns, idempotency, edge-triggered bed requests, ECG alert **upgrade bypass**.
- Kept **triage standing orders** (ECG, big labs, vBGA; aBGA on A/B/C-critical).
- Integrated **SOP loaders** (assist-only): Jena, Notaufnahme (scaffold), Taschenatlas (legacy), **ERC/AWMF overrides**.
- Added **CAP S3 (2021)** hooks, **RUSH** checklists, and **Geriatrics overlay**.
- Provided **synthetic demos** for Atypical ACS, PE, HyperK, CAP, and RUSH+Geri.

What is deliberately deferred

- Local **antibiotic ladders** (CAP/COPD/sepsis) → pending your regimens.
- Role-targeted **alert ladders** (nurse→resident→attending timers).
- Assay-aware **troponin delta** computation (0/1–0/2h) from LIS feed.
- Door-time and **TAT watchers** (kept out to reduce noise).
- Remaining SOP-Notaufnahme topics beyond high-impact scaffold.

Files

- Notebook: ``ed_agent_mesh_FLOW_BUNDLE_v1.ipynb``
- Packs referenced if present: ``jena_sop_policy.yaml``, ``sop_notaufnahme_policy.yaml``, ``taschenatlas_policy.yaml``, ``erc_awmf_overrides.yaml``, ``cap_s3_2021_policy.yaml``, ``rush_acils_policy.yaml``, ``geriatrics_overlay.yaml``.

Next safe increments (when you want details)

- 1) Drop local **ABX regimens** → wire assist-only ladders + durations.
- 2) Add **role-targeted escalation timers** to ``ecg_alert``.
- 3) Implement LIS parsing for **troponin deltas** and add telemetry/O $\blacksquare$ orders (still assist-only).
- 4) Replace Notaufnahme scaffolds with exact steps from PDFs.

— End of day 6.
