

Clinician One■Pager — ED Workflow Coordination

ED Workflow Coordination — Clinician One■Pager (2025-08-16 14:35 UTC)

What this tool is

A **workflow coordination assistant** to reduce administrative load (paging, reminders, SOP surfacing, resource finding). **Not** a diagnostic system. It suggests actions you can **approve**/**dismiss**.

What it does now (PoC)

- Equipment tracking (QR):** scan stickers on ultrasound/crash cart → location & status update, quick **reserve** with expiry, **maintenance/cleaning** flags, charging/docking awareness.
- SOP access:** search by symptom/protocol (e.g., “sepsis bundle”, “HF aFib”); quick■open the SOP document. Usage is logged locally for quality review.
- Time■critical follow■ups:**
- CT pending > 60 min** → **FOLLOW_UP_IMAGING**
- Cath/Endoscopy activation > 30 min** → **FOLLOW_UP_*** reminder
- Chest■pain workflow hygiene (display■only risk awareness):** serial troponin + **second ECG with second troponin**; delta review prompt (no diagnosis).
- Patient■holding safety:** > **2 h** since last assessment → **RECHECK_VITALS**; ≥ **4 h** wait, stable/non■NPO → **OFFER_SNACKS/HYDRATION**.
- Language barriers:** offline **phrase■card hooks** only (no cloud translation; privacy■safe).

What it **doesn't** do

- Doesn't diagnose or override you.
- Doesn't use **age/sex** to drive decisions (to avoid bias). Scores like MEWS/qSOFA/HEART are **display■only**.
- Doesn't send patient data off the device.

How to use it in the demo

- Find equipment:** scan QR → status board updates; reserve if needed; release when done; mark cleaning/maintenance as appropriate.
- Handle reminders:** when a prompt appears, hit **Approve** if acting now or **Dismiss** if handled/already irrelevant.
- Open SOPs:** search (“sepsis”, “chest pain”, “HF aFib”) → open the relevant SOP checklist/flow.
- Chest pain serials:** ensure second troponin triggers a **second ECG** reminder; review delta prompt (display■only).

What we measure (to keep it useful)

- Acceptance rate** (target ≥ 0.65), **alert■fatigue proxy** (target ≤ 0.30)
- Clicks/seconds saved** (admin effort avoided)

- ****Repeat prompts per encounter**** (should trend toward ≤ 1)

Known gaps (PoC)

- No multi-patient ****status board UI**** yet (overdue assessments, vitals deltas).
- SOP ****flowchart/checklist viewer**** is a placeholder.
- Analytics reports (e.g., time-to-find equipment) are basic.
- Maintenance notifications to radiology/biomed not wired to real endpoints.

Near-term improvements (you'll see next)

- Patient status board, SOP checklist tracker, richer analytics.
- More operational skills (e.g., expedite labs for deteriorating patients).

****Bottom line:**** You approve/decline; the assistant reduces the busywork and keeps track of time-critical tasks and resources.
